(54) Title: AN OPTICAL WDM NETWORK HAVING AN EFFICIENT USE OF WAVELENGTHS AND A NODE THEREFOR

(57) Abstract

An optical fiber network of WDM type comprises two fibers (7e, 7w) which carry light signals propagating in opposite direction and which are arranged in a ring configuration, in which always one link (2) between two neighbouring nodes is inactive but provides a standby-link which is used for failure in another link, in the case of which the previously inactive link is made active. An add and drop (1) node used in the network has band blocking filters (31e, 31w) connected in a fiber (7e, 7w) between a drop coupler (17e, 17w) and an add coupler (23e, 23w), taking out a share of the light power in each direction to be received through bandpass filters (37e, 37w) in receivers (11e, 11w) and adding new wavelength channels produced in transmitters (13e, 13w) respectively. Switches (39e, 39w; 33e, 33w) are used for receiving and transmitting on the wavelength channels in correct directions. The positions of the switches can be changed when the inactive link (2) has to become one of the two links directly connected to the node. A very efficient use of the wavelength channels in the network can then be achieved for nodes having a minimum of in-line components and particularly a minimum of in-line filtering components.

International application No. PCT/SE99/00993

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)						
This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:						
Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:						
2. Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:						
Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)						
This International Searching Authority found multiple inventions in this international application, as follows: See next page.						
1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.						
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.						
3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:						
4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is						
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:						
Remark on Protest The additional search fees were accompanied by the applicant's protest.						
No protest accompanied the payment of additional search fees.						

Form PCT/ISA/210 (continuation of first sheet (1)) (July1992)

International application No. PCT/SE99/00993

1st invention: claims 1-5. 2nd invention: claims 6-8.

The special technical feature of the invention according to independent claim 1 is an add/drop node in an optical fiber WDM network, the network having a ring configuration and a band blocking filter arranged between a drop and add coupler, The invention is characterized by the switch connections to the receiver or to the transmitter, for allowing the receiver to receive, and the transmitter to transmit from respectively in either one of two opposite directions.

The special technical feature of the invention according to claim 6 is an optical WDM network having a ring configuration with add/drop nodes characterized by that the nodes are arranged to use at least one wavelength band in such a way that the wavelength band is used by at least two separate first nodes for transmitting to second nodes, which are different form each other, in a first direction and is used by only one third node to transmit to a forth node in a second direction opposite to the first direction.

It is not mentioned in the independent claim 6 something about the filter and the switch connections, which are the special technical feature of claim 1. Thus, the two inventions are not considered to have the same or corresponding special technical feature. Therefore, the application contains two independent inventions and lacks in unity.
